EXPLORATORY TESTING REPORT

EchoGPT — Chrome Extension & Android App

App	EchoGPT (Chrome Extension & Android App)
Tester	Tanjila Akter Khanam
Date	27.09.2026
Duration	Approximately 40 minutes
Environment	Windows 11 (64-Bit), Google Chrome 150.0.7871.187; Realme 7i, Android 11 (Realme UI 2.0)

For this session, I explored the app without following a fixed script. I clicked through different sections, tried a few unusual inputs, and generally paid attention to anything that felt off or confusing rather than just checking whether things worked in the expected way.

I spent most of my time in the chat box, the Upgrade and Subscribe flow, the sidebar tools (Write, Read, Translate, Image, Video), the chat history panel, and the login and logout flow on both the extension and the Android app.

A few things stood out fairly quickly. Some icons don't behave the way they look like they should. The Settings icon, for example, actually opens a Logout popup instead of a settings page. The scissor icon looks like it should be for cutting or trimming something, but it's actually meant for taking a screenshot, and nothing in the interface explains that.

Paid features are another area worth a closer look. Image and Video generation don't mention anywhere that they require payment until after a prompt has already been typed and submitted, which feels a bit like a bait and switch. In a similar vein, a model labeled "Free" still asked for payment when I tried to use it.

A couple of smaller details are easy to miss altogether. The delete icon in chat history only appears on hover, so its presence isn't obvious at a glance. Chat history search also didn't return results for conversations I know exist, so it's worth double-checking whether the search is actually indexing past chats correctly.

The most serious issue I ran into was with the Subscribe Now popup. Once it opens, it keeps shifting position on screen and it's nearly impossible to click anything inside it. Since this is the main entry point for subscribing, this issue effectively blocks the entire monetization flow.

On the Android side, I deleted a test account and then tried signing back in with the same Google account, expecting to be able to start fresh. Instead, the app said the account was disabled and to contact support, with no other option offered.

Overall, the core chat experience feels solid and reliable. The issues I ran into were mostly in the flows around it: payments, login, history, and a handful of icons that don't communicate their purpose clearly. If I had to prioritize fixes, I'd start with the Subscribe Now popup since it stops users from paying at all, then add clear "Paid" labels on Image, Video, and any restricted models so people aren't caught off guard, and finally look into the login session handling and the history search.
